News Release: Visible® rolls out support for Visual Studio 2013 and Microsoft .NET 4.5.

BOSTON, MA – October 31, 2013 – Visible Systems Corporation rolls out support for Visual Studio 2013 along with the latest release of Microsoft .NET framework for **Visible Developer™** thereby providing the flexibility and power to drive n-tier or web applications from data model to executable code. As a software component design and code generator, **Visible Developer** generates 90+% of the business and database access logic for typical business applications using powerful and intuitive modeling features. **Visible Developer's** code patterns translate the model into robust, modular, well-documented code for VB6, ASP, C#, VB.NET and ASP.NET.

“With this release of Visible Developer, software developers are able to take advantage of the new asynchronous features that were added to C# and Visual Basic. Driving development on top of the latest releases of both Visual Studio and Microsoft’s .NET Framework opens up new HTML5 form types to the software developer and enables conversion of user inputs to and from data types inside of the .NET Framework. Visible Developer can run inside of Visual Studio or outside independently of Visual Studio. Either way, with this release, the user can take advantage of these latest features offered by Microsoft.” said Michael Cesino, President and CEO.

BENEFITS:

Develop applications rapidly, not recklessly: Visible Developer's business objects provide a rapid and well-constructed start to a business application. A large amount of time and effort were spent 'building in' good programming practices, sound designs, documentation, and many other time-consuming but equally important tasks that make the difference between a 'prototype' and a 'professional' application.

Scale your business application without rewriting code: One size seldom fits everyone and the same is true when it comes to business applications. Visible Developer generates components that can be packaged to create a 3-tier architecture without changing a single line of code. The building blocks are created for you; you decide how to assemble them.

Make maintenance easier and predictable: Business objects generated by Visible Developer are closer to mass produced manufactured goods. Consistent, structured, modular, and well documented code are the hallmarks of low maintenance business applications.

Focus your effort on adding business value: The code generated by Visible Developer is code you would normally have to write but now you don't. Your starting point is an application with forms, standard modules, and classes that combine to create a 3-tier business object. You are free to concentrate on adding business value, which is what software development is really about in the first place.
